

The new Genie 20S

- small output....BIG SAVINGS

Domestic gas meters have a limit to how much gas can pass through them. The size of the gas meter combined with the output of the existing gas appliances will dictate what size gas fired swimming pool heater can be used.

There are instances when there is not enough 'spare' capacity to run a 35 or 50kW Genie pool heater without changing the gas meter which can be costly.

Not only does changing the gas meter sometimes cause unwelcome costs, the pipework from the gas meter to the pool heater can also do so. Not surprisingly, the larger the pool heater output, the larger the gas pipework and the higher the cost of installation.

For these occasions, we have developed the Genie 20S. With 20kW output it is still powerful enough for most domestic pools. The only compromise is that it will take a little longer to heat the pool from cold or set back temperature. It is still as efficient as the other Genie pool heaters and in comparison will cost no more to heat your pool over the year.

Benefitting from all the existing Genie features the Genie 20S completes the range and ensures there is a Genie to suit all pools.
